1. Introduction

The MiTaxiApp Passenger Ecosystem is an advanced, on-demand taxi booking and dispatch platform designed to connect riders with available service providers seamlessly.

The ecosystem operates across two user-facing channels:

MiTaxiApp Mobile Application: A native Android app designed for immediate on-the-go bookings, utilizing mobile-specific hardware such as GPS tracking, SMS utilities, contacts, and instant push notifications.

MiTaxiApp Web Portal: A web-based application accessible via browsers, allowing passengers to calculate fares, schedule future bookings, edit settings, and access receipts from desktop computers or tablets.

This manual documents the entire passenger workflow, from registration and booking to safety protocols and account management.

2. Getting Started & Registration

2.1 Mobile App Registration & Verification

To register a new account on the MiTaxiApp Mobile Application, passengers follow a secure verification flow:

Mobile Number Input:

Launch the application and select the register option.

Enter your mobile phone number along with the correct international country code.

OTP Verification:

The system automatically triggers a 4-digit One-Time Password (OTP) via SMS to the provided phone number.

Input the 4-digit code into the verification screen before the countdown timer expires. If the message is delayed, a "Resend Code" utility becomes available.

Account Details:

Provide your full name, email address, and a secure password (minimum of 6 characters).

Enter an optional referral or promotional code if shared by a friend to earn account credits.

Finalization:

Read and check the box to agree to the Terms & Conditions and Privacy Policy.

Click "Save & Continue" to complete your account setup and enter the main map dashboard.

2.2 Web Portal Registration & Credit Cards

For users booking rides from their browser, the Web Portal registration offers a streamlined flow:

Initiate Sign Up:

Access the company home page and locate the booking card.

Click on the Create Account button.

Onboarding Option:

Choose to sign up using your Mobile Number or link directly via a Facebook Account.

If registering with a mobile number, input your country code and phone number.

SMS Verification:

Enter the 4-digit OTP code sent to your phone to authenticate your browser session.

Account Details:

Enter your name, email ID, and create a password.

Credit Card Registration (Optional):

To configure cashless bookings on the web, passengers can enter their credit card information (Cardholder Name, Card Number, Expiry MM/YYYY, and CVV).

This card can be saved as the default card. Passengers can also skip this setup step and configure card details later under their payment options.

2.3 Data Consent, Privacy, & Security (Store & Secure)

At MiTaxiApp, user privacy and data security are top priorities. Below is the detailed policy outlining what data is collected, how it is used, and the measures taken to safeguard it.

A. What Data We Collect

To provide a fully functioning ride-booking system, the application requests access to the following information:

Personal Data: Name, password, and registration timestamp to identify and maintain the user account.

Contact Details: Email address, physical address, and mobile number to communicate updates and trip notifications.

Geographical Location: Real-time GPS location data to verify closest driver availability, display map routes, and track transit progress.

Contact Lists: Access to contacts in order to let passengers set up Emergency SOS targets or select friends for Split Fare distributions.

Device Information: Manufacturer name, model, operating system version, SDK version, total/available storage, battery level, and unique device tokens. This is used to monitor app usage and prevent unauthorized access.

Camera & Media Gallery: Access to select or take a photo to set up the passenger's profile image.

Phone Call Utility: Permission to initiate calls directly from the passenger screen to the driver without using the dialer UI.

B. How We Use and Store Your Data

Account Services: Personal and contact data is used to maintain active accounts and authenticate user sessions.

Trip Execution: Location data is transmitted to nearby drivers to facilitate pickup and drop-off coordination.

Local Storage Caching: To minimize network requests and optimize app speed, MiTaxiApp stores geocoding coordinates and search api results in secure local storage.

Background Service Protection: On custom OS devices (e.g., Huawei), MiTaxiApp uses manufacturer-specific background service settings to prevent the device from automatically deactivating the app's location tracker during active trips.

C. How We Secure Your Data

Encryption (SSL): All data transmitted between MiTaxiApp passenger devices, mobile apps, web browsers, and the centralized servers is encrypted using Secure Sockets Layer (SSL) data transfer.

Security Standards: We adopt industry-standard technical and organizational security measures to prevent unauthorized data modification, damage, loss, or access.

PCI Compliance: All credit card processing and gateway token storage (Braintree, Stripe, PayPal) are handled through encrypted tokenization to prevent card details from being stored in plain text.

D. Know Your Rights

Under MiTaxiApp's privacy policy, passengers retain full control over their personal information:

Access & Edit: Passengers can view and modify their profile details, phone numbers, and payment cards at any time.

Consent Withdrawal: Passengers can change permission settings in their mobile operating system to restrict access to location, camera, or contacts.

Account Deletion: Passengers can request the permanent deactivation and de-registration of their account from the settings screen. This process requires password verification to ensure the request is authorized.

3. Core Booking Module

3.1 Local/Normal Taxi Booking

Local bookings are point-to-point taxi requests within city limits:

Set Pickup: The map automatically loads the passenger's current location. Users can adjust the pin manually or type a specific pickup address.

Set Drop-off: Enter the target destination in the "Where to?" address search bar.

Dispatch Request: Tap the booking confirmation button. The system broadcasts the booking request to the closest matching drivers within the geographic search radius.

3.2 Scheduling Rides (Book Later)

Passengers can pre-book rides for a future date and time:

Booking Window: Rides must be scheduled at least one hour from the current local time to ensure driver availability.

Scheduling Flow: Tap the "Schedule" icon, select the desired pickup date from the calendar and pickup time from the clock, confirm the pickup and drop-off addresses, and save.

Status Updates: The scheduled booking appears under the "Upcoming Trips" section. The dispatch algorithm initiates the driver search automatically shortly before the scheduled time.

3.3 Vehicle Categories & Fare Estimation

Before completing a booking, passengers are presented with pricing estimates and car models:

Vehicle Options Slider: Toggle between standard, premium, utility, or luxury categories.

Real-time Calculations: The app displays:

Estimated Time of Arrival (ETA): How quickly the nearest driver can reach the pickup location.

Approximate Fare: A calculated total based on base fare, estimated distance, travel duration, and active tax parameters.

Payment Surcharges: Surcharges such as night rates or peak hour charges are indicated if active in the backend dashboard.

4. Advanced Booking Features

4.1 Multi-Stop Booking (Adding Stops)

Passengers can customize their route by adding intermediate destinations:

Adding Stops: Click the "+" icon next to the address input bar to add mid-route stops.

System Guidance: The system displays a notification alert informing the passenger that adding stops may vary the final fare due to route deviations and increased travel times.

Fare Integration: The pricing algorithm automatically calculates the optimized route connecting all stops sequentially and computes the adjusted approximate fare.

4.2 Split Fare with Friends

For shared rides, MiTaxiApp enables split billing directly from the app:

Setup: During trip configuration, tap the "Split Fare" icon.

Friend Selection: Select contact numbers of companions from the mobile phone contact list.

Allocation: Define the percentage split for each passenger (the total combined percentage must equal 100%).

Verification:

Companions receive split notifications. The app displays their status as Pending, Accepted, or Rejected.

Once split fare is enabled, payment type modifications are locked until the ride configuration is reset or completed.

5. Specialized Travel Packages

5.1 Rental Package (Long Hire)

Rental packages cater to passengers who require a dedicated vehicle and driver for multiple stops over a duration of time:

Configuration: Select the "Rental" package option. Choose from fixed duration-distance plans (e.g., 2 hours / 20 km, 4 hours / 40 km).

Usage: Passengers get the taxi at their disposal to travel to multiple stops.

Overage Charges: If the passenger exceeds the plan's time or distance boundaries, the system automatically bills nominal per-minute and per-kilometer rates for the overage.

5.2 Outstation (Intercity Travel)

Outstation bookings allow passengers to schedule trips to destinations located outside standard municipal limits:

Booking Types: Support both One-Way and Round Trip intercity bookings.

Scheduling: Requires advanced scheduling before the travel date or time.

System Boundaries: If a user attempts to enter a drop-off address outside city limits during local bookings, the system alerts the user and suggests transitioning to Outstation or Rental options.

6. Corporate & Airport Transport Portal

6.1 Airport Pick-ups & Drop-offs

Dedicated booking workflow for airport travelers:

Portal Entry: Select the Airport Booking menu option.

Route Types: Choose from "Airport to Destination", "Destination to Airport", or "Destination to Destination".

Airport Selection: Pick the target airport and matching taxi fleet companies.

Travel Details: Passengers input flight numbers, gate numbers, luggage counts, and custom pickup notes.

6.2 Corporate/Business Account Bookings

For business accounts, the system connects to corporate profiles:

Company Selection: Select the designated corporate profile linked to the user account.

Direct Billing: Trips under corporate profiles are charged directly to the corporate account balance or invoiced through corporate billing, skipping personal card/cash methods.

7. Active Trip Transit Experience

7.1 Real-Time Route & Driver Tracking

Once a driver accepts the booking:

Driver Arrival Status: The screen shows the designated driver's coordinates on the map as they navigate toward the pickup location, along with an ETA.

Trip Transit Tracking: Once the passenger enters the cab, the map shows the transit route. The pickup address is locked and cannot be changed during the active trip.

Share Location: Passengers can share a live tracking link with family/friends to monitor their travel path in real time.

7.2 In-App Passenger-Driver Chat & Calls

Seamless communication channels keep passengers and drivers in sync:

Real-time Chatting: A secure chat interface inside the app allows text messages to be exchanged without disclosing personal phone numbers.

Direct Phone Calling: A quick-action dialer button allows the passenger to call the driver. The call is routed securely to protect user privacy.

7.3 Ride Cancellations & Penalty Rules

Passengers have the flexibility to cancel requests:

Before Driver Arrival: Passengers can cancel bookings from the tracking screen.

Cancellation Reasons: Users select from a predefined list (e.g., cab delay, driver unresponsive, wrong address, booking placed in error).

Cancellation Fees: Depending on backend settings, cancellation charges may apply if a ride is cancelled after the driver has traveled towards the pickup point for a specific amount of time.

8. Post-Trip Processes & Financials

8.1 E-Receipts & Detailed Fare Breakdowns

Upon trip completion, the application generates a comprehensive invoice:

Interactive Summary: The app details:

Base Fare: Flat starting rate for the vehicle category.

Distance Fare: Charge computed per kilometer traveled.

Minutes Fare: Charge computed for the travel duration.

Waiting Fare: Charge applied for driver wait times.

Surcharges: Surcharges such as night charges or evening peak rates.

Discounts: Promotional discounts deducted from the total.

Net Total: Final paid sum indicating the payment type (Cash, Wallet, Card).

8.2 Driver Ratings & Quality Feedback

To maintain system-wide service quality, passengers rate their ride:

Star Rating: Give a rating from 1 to 5 stars.

Comments: Input text feedback describing the experience. If the passenger attempts to submit feedback without a star rating, the system prompts a validation check.

9. Prepaid Wallet & Promotions

9.1 Wallet Recharge & Payment Gateways

The prepaid digital wallet allows cashless payments:

Cashless Checkout: When selected as the primary payment method, trip costs are automatically deducted from the wallet balance.

Recharging: Tap "Add Money", choose from preset recharge amounts or type a custom amount, and process payment securely via integration with Braintree, Stripe, or PayPal gateways.

Insufficient Funds Alert: If the wallet balance is lower than the booking's estimated fare, the system displays an alert recommending a wallet top-up before confirming the ride.

9.2 Promo Codes & Referrals (Invite Friends)

Promotions provide savings for riders:

Promo Code Entry: Input promotional coupon strings during booking or within the wallet tab to apply instant discounts.

Invite Friends: Passengers can share their unique referral code via SMS, Email, Facebook, WhatsApp, or Twitter. When a new user registers and rides using the code, the referrer earns account credits.

10. Passenger Preferences & Safety

10.1 Favorite Places & Favorite Drivers

Personalized settings speed up the booking process:

Favorite Places: Bookmark addresses as Home, Office, Airport, or Others.

Favorite Drivers: Add reliable drivers to a favorites list. Users can also delete drivers from this list.

10.2 Emergency Contacts & SOS System

MiTaxiApp incorporates real-time emergency safety tools:

SOS Button: A visible emergency button located on the top dashboard header.

Configuration: Add up to 3 emergency contacts from the phone's contact list.

SOS Behavior: Clicking the SOS button triggers an immediate confirmation. Upon acceptance, the system sends an SMS alert containing coordinates and live tracking links to the emergency contacts.

11. Account Management & Security

11.1 Profile Editing & Password Updates

Passengers can keep their profile data up to date:

Profile Details: Edit first name, last name, phone number, physical address, and upload a profile picture.

Password Updates: Securely change account passwords by verifying the old password before setting and confirming a new one.

11.2 Account Deactivation & Deletion

Under privacy settings, passengers can delete their profile:

Account Deletion Request: Selecting "Delete Account" initiates the account termination workflow.

Verification: The user must enter their account password to confirm the deactivation request, preventing accidental or unauthorized deletions.

11.3 Log Out & Session Management

Logging Out: Tap "Logout" at the bottom of the navigation drawer.

Session Clearing: Confirming deactivates the user session on the server and clears locally cached tokens, returning the user to the Sign In screen.
